

Active Life & STARband® Cranial Remolding Solutions

Active Life and Orthomerica STARband clinicians are committed to cranial remolding recommendations for only those infants with moderate to severe deformities. These infants are managed by the interdisciplinary team and treatment recommendations are made based on age, severity, developmental stages, and other factors. In order to produce the best possible outcomes for infants with skull deformities, clinicians choose the STARband for the following reasons:

GOLD STANDARD

- With over 350,000 infants treated worldwide, the STARband is the most prescribed cranial orthosis to treat infants with skull deformities.
- The STAR Family of designs includes five (5) specialized orthoses that are further customized for each infant.

EXCEPTIONAL CLINICAL OUTCOMES

- There are many peer-reviewed published articles regarding STARband/STARscanner – recent studies are provided upon request.
- Experienced clinicians use the STARband, which allows successful completion of treatment for over 98%+ of all plagiocephaly patients with **ONE** helmet.
- The STARband has always been designed to allow ongoing clinical adjustments to meet the growth potential of moderate to severe skull deformities. Other cranial designs accommodate only incremental growth and therefore require consecutive helmets to achieve the same outcomes.

ONE HELMET GUARANTEE

- Only in the most severe deformities or unusual circumstances do infants with deformational plagiocephaly require a second orthosis. As long as the caregivers have complied with the 23 hours per day wearing schedule and all care instructions, a second STARband may be considered at no charge.

SIGNIFICANT COST SAVINGS

- Follow-up visits are scheduled based on the needs of the infant to minimize inconvenience and travel costs to the family. Each infant is unique, as is their cranial care program.
- Parents/payers save thousands of dollars in treatment costs using only one STARband versus multiple helmets from other cranial providers.

CRANIOFACIAL TEAMS

- Most craniofacial teams across the country also choose to prescribe the STARband for post-operative craniostylosis and deformational plagiocephaly. Quite simply, their expertise demands the best!

CUTTING EDGE SCANNING TECHNOLOGY

- Advanced technologies such as the STARscanner® and SmartSoc™ systems capture three-dimensional head shapes and provide detailed anthropometric reports. These reports are used to determine appropriate treatment options and document treatment outcomes.
